result %>% plot()
```

embedR

The embedR package is an open-source R package to generate and analyze state-of-the-art text embeddings. Providing access to free and paid APIs from Hugging Face, OpenAI, and Cohere, the package offers functions to generate, group, project, label, and visualize text embeddings.

A Century of Fire Suppression Is Why California Is in Flames

The reason that California's forest fires are so bad is because the people in charge have deliberately allowed large amounts of fuel to build up.

The details in this paragraph explain the very different results of proper forest management vs allowing large amounts of fuel to build up.

California is either run by idiots who don't understand proper forest management, or it's run by evil people who are deliberately making the fires worse.

<https://www.motherjones.com/environment/2017/12/a-century-of-fire-suppression-is-why-california-is-in-flames/>

A Century of Fire Suppression Is Why California Is in Flames

The acrid smell of charred wood still permeates the air as Sasha Berleman, a fire ecologist, and I walk along a dirt path up through the middle of a canyon in the Bouvierie nature preserve in Sonoma Valley. On the left side, the earth is black as tar, and scorch marks as tall as a person scar the trunks of the mature oak trees scattered throughout the field. But on the right side, the ground is tan and brown, and you have to look hard at the still-green oaks to see any evidence of the fire that raged through here just a few weeks before. It's no mystery to Berleman why the fire behaved so differently on the two sides of the trail at Audubon Canyon Ranch's Bouvierie Preserve. When flames hit the field on the left of the path, they met a dense wall of thigh-high grass that hadn't been mowed, grazed or burned for 20 years. The flames must have been 5 or 6 feet tall. On the right side, however, Berleman had set a prescribed burn just this spring. So when the October wildfire hit, patches of fire blazed, but with so little fuel, the flames remained only inches high.

Firefluffer • 3y ago

This isn't just a California problem and it isn't just a fire suppression issue. It's a lot more complex than that. The fires in Oregon last year proves that. Oregon has more clear cuts than pretty much any place in the world and still burned through cities. Climate change is real and it's a very real part of this problem. The Forest Service started a policy of fire suppression nation wide and it's a part of the problem. It's not just California.

We have a very dangerous problem on our hands and there's not a simple place to put the blame and not a simple solution. It's hotter, drier, with greater wind events in more dead fuels with more urban edge against those fuels.

FlyingZebra34 • 3y ago

Exactly this. Fuel build up from fire suppression definitely exasperates the issue but generally the forests are drier, hotter, and more susceptible to fire. Global warming is the most damning factor.

Fun-Ad915 • 3y ago

and the big issue as well is in Australia at least was the catastrophic fire weather negated the effectiveness of our fuel reduction measures

DVWLD • 3y ago

Yep. Was hot and dry enough for black ground to burn at times. Not much you can do once it's at that point.

DanielAlman OP • 3y ago

If global warming is the biggest factor, then why were the two sides of the road so different from each other?

MUCH better example of democracy than the USA, who makes voting more difficult than necessary (like only 1 day in working day) and the impact of vote is questionable (electoral college).

Predicting risk perception
with GPT-4-Turbo

The screenshot shows a conversation between a user ('You') and ChatGPT. The user asks for a numerical estimate on a scale from -100 (safe) to 100 (risky) for the entity 'robot'. ChatGPT responds with the value 30. The user then asks for a numerical estimate for the entity 'virus' on the same scale. ChatGPT responds with the value 70. At the bottom right of the message area, there are four small icons: a speaker icon, a folder icon, a circular arrow icon, and a thumbs-down icon.

You
On a scale from -100 (safe) to 100 (risky), how risky or safe is 'robot'? Respond with a numerical estimate.

Bycatch -the retained catch of non-target but commercially viable species, plus all fisheries discards - is an element of almost every marine capture fishery. Fishing mortality through bycatch in purse seines and pelagic longlines, the two main gear types used to catch tunas, is a primary source of the drastic global population declines observed in several species of marine megafauna, including sharks, rays, cetaceans, seabirds and sea turtles. As seafood consumers around the world are progressively sensitized to the ecological implications of fisheries bycatch, customer preferences have translated into an increasing demand for seafood that is certified through eco-labelling or certification schemes...

Paraphrasation

To characterize and organize decision-related proverbs

The proverb "curiosity kills the cat" warns that excessive inquisitiveness can lead to trouble or danger. It implies that exploring unknown or risky matters may result in harm, highlighting the potential perils of being overly curious or meddling in affairs best left alone.

Write a 50-word description of the proverb "fortune favors the brave"

The proverb "fortune favors the brave" suggests that bold actions often lead to success. It emphasizes that taking risks and showing courage can attract good luck and positive outcomes. This saying encourages proactive and fearless behavior, implying that opportunities are more likely to come to those who are daring.

Write a 50-word description of the proverb "the ship has sailed"

The proverb "the ship has sailed" signifies that an opportunity has been missed and cannot be reclaimed. It suggests that the moment to act has passed, often due to hesitation or delay, and now it's too late to seize the chance or achieve the desired outcome.

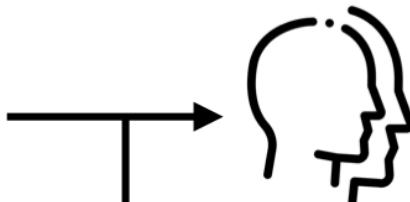

Proverb 1 of 49528

Fortune favors the bold

Summarize the gist of the proverb.

1

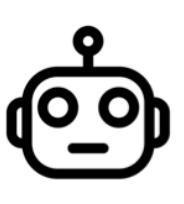

This proverb suggests that those who take risks and act decisively are more likely to succeed than those who are timid and hesitant.

Provide taxonomic tags capturing the proverb's topic.

2

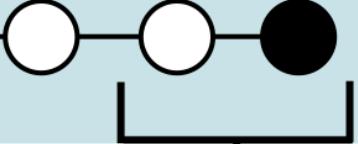

1. decision making
2. risk management
3. success

Does the proverb provide guidance on how to act or make decisions?

3

No  Yes

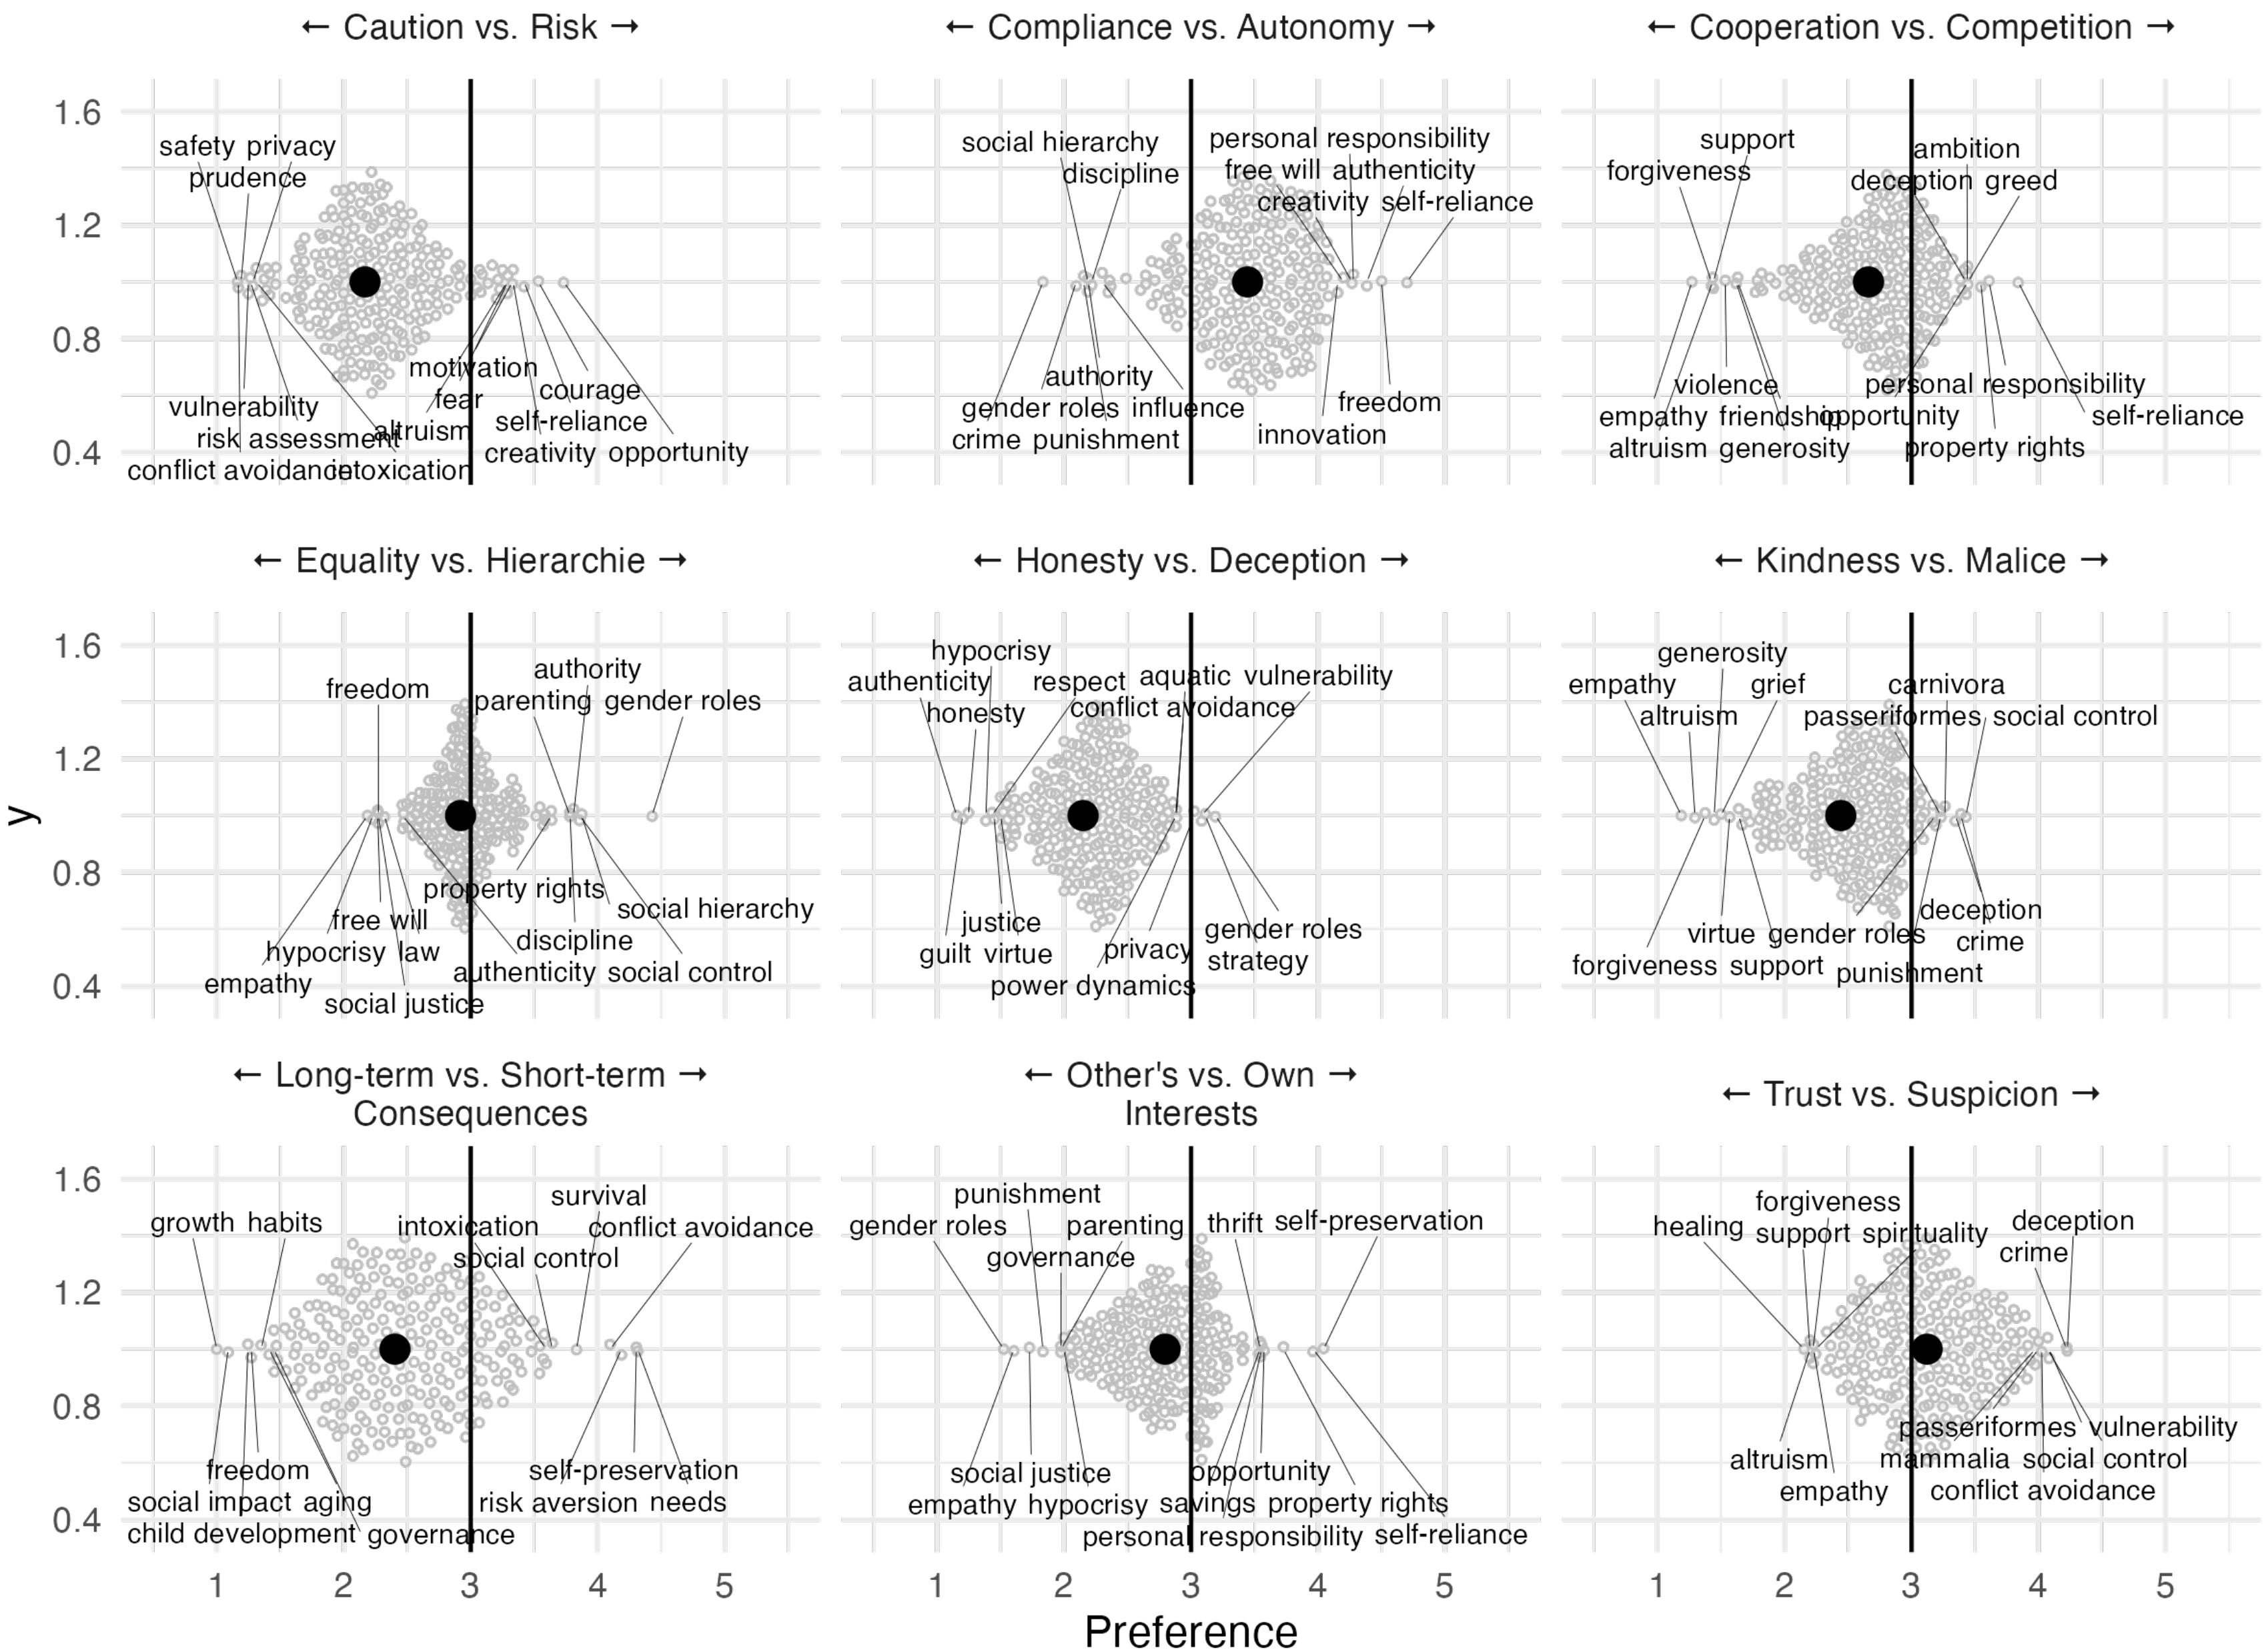

What does the proverb favor?

4

Risk		Caution
Short-term consequences		Long-term consequences
Own interests		Other's interests
Autonomy		Compliance
Trust		Suspicion
Honesty		Deception
Equality		Hierarchie
Kindness		Malice
Cooperation		Competition

Proverbs advocate safety, autonomy, cooperation, honesty, kindness, and a focus on long-term consequences and other's interests

Pressure Testing GPT-4 128K via "Needle In A HayStack"

Asking GPT-4 To Do Fact Retrieval Across Context Lengths & Document Depth

Goal: Test GPT-4 Ability To Retrieve Information From Large Context Windows

A fact was placed within a document. GPT-4 (1106-preview) was then asked to retrieve it. The output was evaluated for accuracy.

This test was run at 15 different document depths (top > bottom) and 15 different context lengths (1K > 128K tokens).

2x tests were run for larger contexts for a larger sample size.

Against Justaism: A call for more measured discussions on LLM cognition

Zak Hussain^{1,2*}, Rui Mata¹ and Dirk U. Wulff^{2,1}

¹*University of Basel.
²Max Planck Institute for Human Development.

*Corresponding author(s). E-mail(s): z.hussain@unibas.ch;
Contributing authors: rui.mata@unibas.ch; wulff@mpib-berlin.mpg.de;

Abstract

Are large language models (LLMs) "just next-token predictors" devoid of cognitive capacities such as "thought" or "understanding"? We argue from a cognitive science perspective that it is far from self-evident that such perspectives hold despite their prominence in current discussions surrounding LLMs. We make our case by critically evaluating different flavors of *Justaic* reasoning and end with a call for more measured discussions on LLM cognition.

Keywords: large language models, cognition
